

QuickTalker Freestyle Success Story

Taylor, Mom to Cedar

“

I was able to hear that he loved me. He said, “I Love you mama” on it. That was the first time I ever heard my child say that he loves me.

Meet Taylor, mom to four year old Cedar. Cedar has a speech delay and continued to struggle with speech. Taylor found herself hesitating when considering the use of a QuickTalker Freestyle communication device for him. She was afraid that such a device might hinder Cedar's natural progression toward spoken language.

However, Taylor's reservations took an unexpected turn when Cedar's speech-language pathologist (SLP) introduced her to compelling research that actually demonstrates the opposite effect. The research showed that young children who experience complex communication needs benefit from AAC devices and strategies to help aid in the development of language, literacy, communication, and cognitive development. The earlier AAC is incorporated into their lives, the greater the potential for improved outcomes.

Armed with evidence and newfound hope, Taylor embarked on a journey to embrace the QuickTalker Freestyle, discovering that augmentative communication can be a powerful catalyst in fostering verbal development and enriching Cedar's overall communication skills.
